Isolated , secretory and transmembrane other PRO polypeptides, link bioactive polypeptides, and detect the presence communication of the presence of the prese Gerritsen 2001-408281/43. AAS21259 Stewart TA, Beresini M, ME, Goddard Tumas D, Deforge L, Desnoyers L, A, Godowski PJ, Gurney ; Tumas D, Watanabe CK, W e PRO polypeptide used to detect e molecules to cells expressing of mammalian tumors e.g. lung, y AL, She Wood WI, Filvaroff E, Sherwood S detect Σ, PRO

Claim 12; Fig 32; 813pp; English

prostate,

cervical.

ANUI2172-AAU12446 represent novel human secretory and transmembrane PRO CC polypeptides. The PRO polypeptides are useful to detect other PRO CC polypeptides, to modulate biological activities of cells expressing PRO CC polypeptides, and to detect the presence of mammalian lung, colon, CC present, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC proliferantion of condition of the Proliferation or gene expression in CC pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or of T-CC lymphocytes, the release of a cytokine from peripheral blood monocytes (C PBMCs), or the proliferation of endothelial cells. Some of the PRO CC polypeptides may modulate glucose or free fatty acid uptake by skeletal CC (TIA. The PRO polypeptides can be used in assays to identify molecules crowled in binding interactions. The polynucleotides encoding PRO Some

English.

The invention relates to an interleukin 20 (IL-20) soluble receptor comprising two polypeptide subunits IL-20RA (formerly known as ZcytoR7) and IL-20RB (formerly known as DRRS1). The two subunits are preferably linked together. In one embodiment, one subunit is fused to the constant region of the light chain of an immunoglobulin, and the other subunit is fused to constant region of the heavy chain of an immunoglobulin. The light chain and the heavy chain are connected via a disulphide bond. The soluble receptor can be used to down-regulate IL-20 and thus treat

The present sequence is human cytokine receptor protein, designated as CC G992. G992 is a member of the Class II cytokine receptor (CRF2) family, CC which includes R1 and R2 of chains of the II-10 receptor complex, IRM-CC alpha receptor complex, and tissue factor (TF). G992 DNA and proteins are used in the prevention, diagnosis and treatment of diseases associated with inappropriate cytokine receptor expression such as inflammatory complex include complex journal participation. These disorders include complex journal participation. These disorders include complex journal participation, archivitis, vasculitis, vasculitis, lupus, immune complex journal participation, archivitis, archivitis, vasculitis, lupus, creating various immune deficiencies and disorders such as severe combined immunodeficiency (SCID) and autoimmune disorders such as severe combined immunodeficiency (SCID) and autoimmune disorders such as severe combined immunodeficiency (SCID) and autoimmune disorders disorders (e.g., Alzheimer's disease); sarcoidosis; leukaemias (e.g., erythroleukaemia); inflammations such as graft versus host disease (GVHD), inflammatory bowel disease and endotoxin shock; hyperproliferative disorders (e.g., porlasis); cancers (e.g., non-Hodgkin's lymphoma, prostate cancer) and componiesis com
                                                       haematopolesis regulating activity, tissue growth activity, haemostatic and thromolytic activity, receptor/ligand activity and anti-inflammatory activity. CG92 is also used in assays to identify modulators of cytokine receptor expression and their activities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotides encoding human cytokine receptor preventing, diagnosing and treating inflammation

The invention relates to treating a mammal afflicted with a disease in which an interleukin-20 (IL-20) polypeptide plays a role, involves administering antagonist of IL-20 polypeptide to the individual. The method is useful for treating psoriasis, eczema, atopic dermatitis, contact dermatitis, adult respiratory disease, asthma, bronchitts and pneumonia and is also useful for treating multiple organ failure, inflammatory lung injury, septic shock, bacterial pneumonia, inflammatory bowel disease, rheumatoid arthritis, ulcerative colitis and Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating interleukin-20 induced inflammation in a mammal, such as adult respiratory disease, eczema, psoriasis, contact dermatitis, multiple organ failure and septic shock, involves administering IL-20 antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 311 AA;

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: The IL20RA/IL20RB dimer is a receptor for IL19, IL20:

IL24. The IL22RA1/IL20RB dimer is a receptor for IL20 and IL24.

IL21. The IL22RA1/IL20RB dimer is a receptor for IL20 and IL24.

SUBUNIT: Heterdimer with IL20RA and heterodimer with IL22RA1.

SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
                                                                                                                the European Bioinformatics Institute. Interleukin (IL)-22, a novel human cytokine that signals through Interferon receptor-related proteins CRF2-4 and IL-22R.";
J. Biol. Chem. 275:3133-31339(2000).
C -- FUNCTION: Receptor for IL10 and IL22. Serves as an accessory cessential for the active IL10 receptor complex and to initiate C -- FUNCTION: Receptor Itransduction events.
C -- SUMCELLULAR LOCATION: Type I membrane protein.
C -- SIMILARITY: Belongs to the type II cytokine family of receptor complex and to initiate complex in the sum of the sum
